

TurnAid

Turning and Moving System

TurnAid is an electrically driven turning sheet. TurnAid was developed to optimise the situations in relation to the caring, moving, and bed solutions for persons with severe physical disabilities in hospitals, institutions, or their own home. TurnAid improves the working environment just as it increases the safety and the dignity of the work, enabling these care beds to turn and move individuals easier and more discretely. In "stand by" mode, TurnAid is set in a low position, where the care-needed is not only shielded by the safety of the bed rails but the person is also placed in an ethical and dignified position with a free view of their surroundings. TurnAid handles persons with a weight up to 200kg and does so with maximum consideration of the care-needed of the individual and the staff. TurnAid is easily mounted on most care beds as it comes with a built-in universal fitting together with length and width adjustment. This enables TurnAid to comply with the Medical Directive's strict demands to the area.

Features

- Optimizes the workflow associated with the reversal, displacement, and seating of persons with severe physical disabilities
- Improves the working environment as well as increasing safety and dignity
- Easily installed on most types of care beds using the built-in universal bracket & meets Medical Directive
- 200kg SWL
- Accessories include foot control, extra hand control, and white sheets

Technical Specifications

Unit capacity: 200 kg
